

# Benzene Thermophysical Properties from 279 to 900 K at Pressures to 1000 Bar

Robert D. Goodwin

Thermophysics Division, National Engineering Laboratory, National Institute of Standards and Technology, Boulder, Colorado 80303

Received April 15, 1987; revised manuscript received April 13, 1988.

The thermodynamic data for benzene have been evaluated and fit to a highly constrained, nonanalytic equation of state. Comparisons of the equation with the selected PVT and derived property data are given. Extensive tables are presented providing tabular values for coexisting liquid and vapor as well as for the single phase along isobars. The equation of state and tables cover the range from the triple point (278.68 K) to 900 K, with pressures to 1000 bar.

Key words: benzene; compressibility factor; density; enthalpy; entropy; equation of state; fugacity; heat of vaporization; ideal gas; Joule-Thomson coefficient; orthobaric density; specific heat; speed of sound; thermodynamic property; vapor pressure; virial coefficient.

### Symbols and Units

Subscripts c and t refer to critical and to triple points	
Subscripts g and l refer to saturated vapor and liquid	
Subscript $\sigma$ refers to liquid-vapor coexistence	
$\alpha, \beta, \gamma, \epsilon, \eta, p$	exponents in various functions
$C_\sigma(T)$	saturated liquid heat capacity, J/(mol K)
$C_v(\rho, T)$	isochoric heat capacity, J/(mol K)
$C_v(T)_\sigma$	isochoric heat capacity at the liquid boundary, J/(mol K)
$C_p(\rho, T)$	isobaric heat capacity, J/(mol K)
$f$	fugacity, bar
$f/P$	fugacity/pressure ratio
$F(\rho, T)$	defined function in the EOS
$G(\rho, T)$	Gibbs energy, J/mol
$H(\rho, T)$	enthalpy, J/mol
$H_0^\circ$	enthalpy for ideal gas state at $T = 0$
$\Delta_{\text{vap}} H$	enthalpy of vaporization, J/mol
$J$	joule, 1 N m
$L$	liter, $10^{-3} \text{ m}^3$
$P$	pressure in bar, 1 bar $\equiv 10^5 \text{ Pa}$
$P^\circ$	standard state pressure, 1 atm $= 1.013\,25$ bar $= 0.101\,325 \text{ MPa}$
$P_\sigma(T)$	vapor pressure of saturated liquid, bar
$P_\sigma(\rho)$	$P_\sigma[T_\sigma(\rho)]$ , vapor pressure as function of density
$R$	gas constant, 8.3145 J/(mol K)
$\rho$	density, mol/L
$\sigma$	$\rho/\rho_c$ , reduced density
$S(\rho, T)$	entropy, J/(mol K)
$T$	temperature, K
$T_\sigma(\rho)$	liquid-vapor coexistence temperature, K
$\theta(\rho)$	defined locus of temperatures for the EOS, K
$U(\rho, T)$	internal energy, J/mol
$U_0^\circ = H_0^\circ$	22 279.294 J/mol (selected)
$u(\rho, T)$	$T/T_\sigma(\rho)$ for the EOS
$v$	$1/\rho$ , molar volume, L/mol
$\mu$	Joule-Thomson coefficient

$\omega(\rho, T)$	$[1 - \theta(\rho)/T]$ , for the EOS
$W(\rho, T)$	speed of sound, m/s
$x(T)$	$T/T_c$ , reduced temperature for the EOS
$x_o(\rho)$	$T_o(\rho)/T_c$ , reduced coexistence temperature for the EOS
$Z(P, \rho, T)$	$P/(\rho R T)$ , compressibility factor
The molecular weight of benzene was taken to be 78.114.	

selected to be 561.75 K. Our critical-point density, 3.90 mol/L, is adjusted for a best fit of orthobaric densities, as compared with  $3.86 \pm 0.01$  mol/L in Ref. 18. Our critical-point pressure, 48.7575 bar, is from vapor-pressure Eq. (2) at  $T_c = 561.75$  K.

Our triple-point temperature, 278.68 K, is from Oliver *et al.*,<sup>20</sup> and from Jackowski,<sup>21</sup> while our normal boiling-point temperature is from vapor pressure Eq. (2) below. Our triple-point pressure is from Eq. (2), while fixed-point phase densities are from Eqs. (3) and (4) for orthobaric densities.

## 1. Introduction

No thorough correlation is available for the thermophysical properties of benzene. Properties for the saturated liquid were given in 1972 by Ambrose and Lawrenson<sup>1</sup>. Unpublished 1973 tables by the Engineering Sciences Data Unit, Ltd. (ESDU) were mentioned in 1976 by Counsell *et al.*,<sup>2</sup> who give coexistence properties. The brief 1975 tables by Vargaftik<sup>3</sup> are sparsely documented. Saturated liquid properties were given in 1977 by Akhundov and Abdullaev<sup>4</sup>; in 1978 by Zavaraykina *et al.*<sup>5</sup>; and in 1979 by Chao.<sup>6</sup> In 1984, Kratzke *et al.*<sup>7</sup> reported residual Helmholtz energies for the saturated and compressed liquid at temperatures up to 465 K.

In this report we use a version of the nonanalytic equation of state (EOS), which was used recently for hydrogen sulfide<sup>8</sup> and for carbon monoxide.<sup>9</sup> The density-temperature phase diagram for benzene is outlined in Fig. 1. Selected fixed-point values are given in Table 1.

Critical-point constants of recent workers<sup>1,10-19</sup> are listed in Table 2. Older values are given by Gornowski *et al.*<sup>10</sup> and by Ambrose *et al.*<sup>14</sup> Our critical-point temperature was

## 2. Developing the Equation of State

The isochoric EOS is constrained to a given liquid-vapor coexistence boundary. We therefore first formulate the melting line, the vapor pressures, and the orthobaric densities. The evaluation of masses of data, to cull inaccurate but sometimes precise sets, is a necessity. Hence, some excluded data in this report are weighted zero, and are tabulated for reference.

### 2.1. Melting and Vapor Pressures

#### 2.1.a. The Melting Line

Data<sup>22-30</sup> are shown by Fig. 2, with ranges given in Appendix A, and deviations are given in Table 3 from the fitting function

$$(P_m - P_t)/\text{bar} = [a + bx]x, \quad (1)$$

where  $P_m$  is the melting pressure,  $P_t$  the triple-point pressure,  $x \equiv (T/T_t - 1)$ ,  $a = 9600$ , and  $b = 7650$ . All data and references have been taken from Figuière *et al.*,<sup>30</sup> except for the data of Makita and Takagi.<sup>26</sup> The Simon equation gives an exponent greater than 2.0 for these data, e.g.,

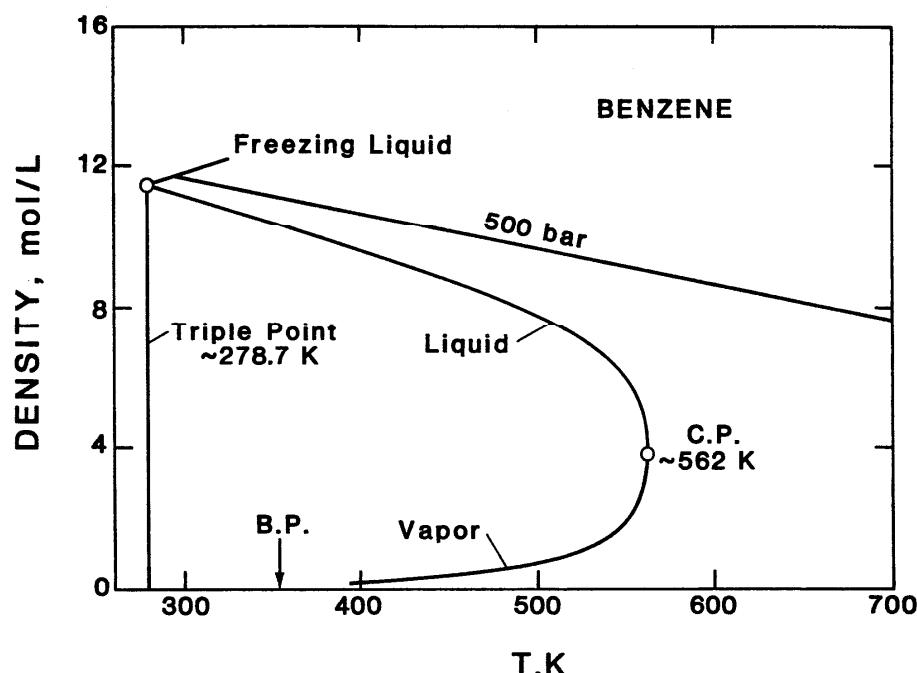

FIG. 1. Density-temperature phase diagram for benzene.

TABLE 1. Selected fixed-point values for benzene (Critical compressibility factor,  $Z_c = 0.26767$ )

	Triple point	Boiling point	Critical point
T/K	278.680	353.240	561.75
P/bar	0.04785	1.01325	48.7575
$\rho/(mol/L)$			
vapor	0.002074	0.035687	3.90
liquid	11.4766	10.4075	3.90

$$(P_m - P_t)/bar = 4237 [(T/T_t)^{2.3} - 1]. \quad (1a)$$

### 2.1.b. The Vapor Pressures

Table 4 presents a selection of recent experimental and some correlated vapor-pressure data for benzene.<sup>1,11,16,21,31,32</sup> Appendix A gives a comprehensive list of references<sup>1,10,11,15,16,21,31-39</sup> for vapor pressure data for benzene. Let  $x \equiv T/T_c$  then, for  $P_\sigma$  in bar, and with  $p = 1.70$  for the exponent,<sup>40</sup>

$$\ln(P_\sigma) = a/x + b + cx + dx^2 + ex^3 + f(1-x)^p, \quad (2)$$

$$\begin{aligned} a &= -10.655\ 375\ 280, & d &= 20.208\ 593\ 271, \\ b &= 23.941\ 912\ 372, & e &= -7.219\ 556\ 515, \\ c &= -22.388\ 714\ 756, & f &= 4.847\ 283\ 265. \end{aligned}$$

In the eighth column of Table 4,  $dP/dT$  is the slope in bar/K. For 116 selected data the rms (root-mean-square) of relative pressure deviations is 0.035%.

## 2.2 The Orthobaric Densities

### 2.2.a. Saturated Liquid Densities

Table 5 presents a selection of experimental and correlated data for benzene.<sup>18,38,41-43</sup> Appendix A gives a comprehensive list of references<sup>1,10,15,17-19,37,38,41-48</sup> for saturated liquid densities for benzene. The large deviations of some data near  $T_c$  follow from differences in the critical temperatures of different authors. The argument for our formulation is  $u(T) \equiv (1 - T/T_c)$ . With  $\beta = 0.35$ ,

$$(\rho_1/\rho_c - 1) = au^\beta + bu + cu^2 + du^3, \quad (3)$$

$$\begin{aligned} a &= 1.960\ 0182, & c &= -1.585\ 6640, \\ b &= 1.062\ 8812, & d &= 2.092\ 6704. \end{aligned}$$

TABLE 2. Recently-reported critical constants for benzene

Reference	Year	$T_c/K$	$P_c/bar$	$\rho_c/(mol/L)$
Gornowski <i>et al.</i> (Ref. 10) <sup>a</sup>	1947	562.65	49.345	3.810
Bender <i>et al.</i> (Ref. 11)	1952	$562.09 \pm 0.05$	$48.98 \pm 0.03$	$3.953 \pm 0.05$
Kay and Nevens (Ref. 12)	1952	561.86	48.90	3.802
Simon (Ref. 13)	1957	...	...	3.897
Ambrose <i>et al.</i> (Ref. 14) <sup>a</sup>	1960	562.09	...	...
Connolly and Kandalic (Ref. 15)	1962	561.99	48.92	...
Ambrose <i>et al.</i> (Ref. 16)	1967	...	48.98	...
Campbell and Chatterjee (Ref. 17)	1969	562.10	48.86	3.917
Artyukhovskaya <i>et al.</i> (Ref. 18)	1970	561.80	...	$3.857 \pm 0.01$
Ambrose and Lawrenson (Ref. 1)	1972	562.16	48.98	3.891
Hales and Townsend (Ref. 19)	1972	...	...	$3.89 \pm 0.05$
Used here		561.75	48.7575	3.90

<sup>a</sup>These authors give older values from the literature.

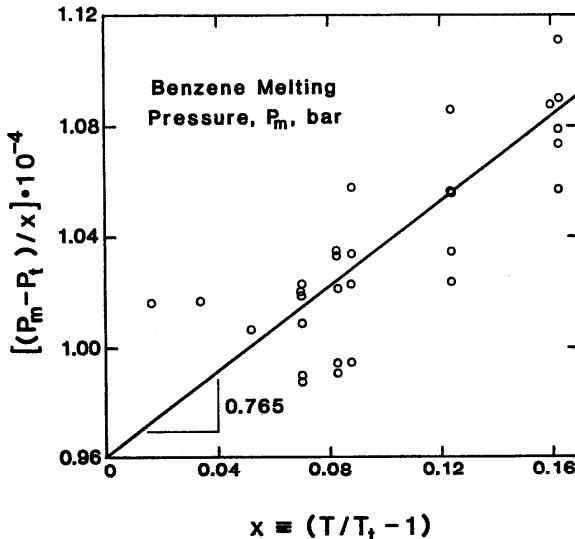

FIG. 2. Melting pressure of benzene.

In the eighth column of Table 5,  $d\rho_1/dT$  is the slope of the orthobaric liquid densities curve in mol/(L K). The rms relative deviation for 61 selected saturated liquid densities is 0.24%.

### 2.2.b. Saturated Vapor Densities

Table 6 presents a selection of experimental and some correlated data for benzene.<sup>7,15,18,31,37,43,49-54</sup> Appendix A gives a comprehensive list of references<sup>1,2,7,10,15,17,18,37,42</sup> for saturated vapor densities for benzene. Enthalpies of vaporization have been used in the Clapeyron equation with Eqs. (2) and (3) to derive vapor densities at the same points as given in experimental papers.<sup>31,49-53</sup>

The compressibility factor for saturated vapor is formulated by using  $x(T) \equiv T/T_c$ ,  $u(T) \equiv (1 - x)$ , and  $\beta = 0.35$ ,

$$\begin{aligned} Z_\sigma(T) &= 1 + (Z_c - 1)g(x)\exp[f(x)], \\ g(x) &= (T/T_t)^n, \quad n = 0 \text{ at } T \geq T_t, \\ n &= 3 \text{ at } T < T_t, \\ f(x) &= A_1 u^\beta + A_2 u + A_3 u^2 + A_4 u^3, \end{aligned} \quad (4)$$

where

In the eighth column of Table 6,  $d\rho_g/dT$  is the slope of the vapor-densities curve in mol/(L K). The last column gives the experimental residuals

$$f(Z) \equiv -\ln\{(Z-1)/(Z_c-1)\}. \quad (4a)$$

The rms relative deviation for 130 selected vapor densities is 0.32%.

### 2.3. The Second Virial Coefficient

Data for the second virial coefficient of benzene are summarized by Pompe and Spurling<sup>55</sup> and by Dymond and Smith<sup>56</sup> who recommend the formulation of Al-Bizreh and Wormald<sup>57</sup> from 295 to 630 K. Let  $x \equiv T/100$ , the second virial coefficient  $B(T)$  is represented by

$$B(T)/(L/mol) = 0.0415 - 1.118/x - 3.850/x^2 - 1.289/x^3 - 51.58/x^4. \quad (5)$$

We have used this in the truncated virial equation of state,

$$Z(P, \rho, T) = 1 + B(T)\rho + \dots \quad (5a)$$

to derive some  $P\rho T$  data at the same points reported in Al-Bizreh and Wormald,<sup>57</sup> as shown in Table 8.

### 2.4. Pressure-Density-Temperature Data

The  $P-T$  maps of the principal  $P\rho T$  data for benzene are shown in Figs. 3–5. Table 7<sup>10,15,30,38,41,43,44,48,57–60</sup> summarizes ranges of the data and gives deviations from our EOS, Eq. (6), while Table 8 compares individual data with this EOS. Appendix A gives a comprehensive list of references<sup>10,15,30,38,41,43,44,48,58–65</sup> for  $P\rho T$  data for benzene.

The  $P\rho T$  data of Connolly and Kandalic<sup>15</sup> were reported by an equation. Data of Figuière et al.<sup>30</sup> occur at low temperatures, at pressures up to the melting line, as do those of Kurumov et al.<sup>48</sup> Data of Gehrig and Lentz<sup>58</sup> along isochores cover the widest range (Fig. 5), but densities between adjacent isochores may be irregular; see Table 8 where data are arranged along isotherms. The data of Glanville and Sage<sup>44</sup> have small, systematic deviations from our EOS. The critical-region data of Gornowski et al.<sup>10</sup> were obtained using a mercury-in-glass thermometer. The Mamedov et al.<sup>59</sup> data are a summary of Russian work, with few points over a wide range. Both Kuss<sup>41</sup> and Taslimi<sup>60</sup> give isothermal  $P\rho T$  data to high pressures at temperatures up to the normal boiling point, and via Tait equations, give also the derived isothermal compressibilities,  $\rho(\partial P/\partial \rho)_T$ .

Recently, a new set of  $P\rho T$  data was obtained here by Straty.<sup>43</sup> These pseudoisochores at  $1.2 < \rho < 9.3$  mol/L extend to 723 K or to 350 bar as boundaries. We finally have used for the equation of state only data from the virial equation (Al-Bizreh and Wormald<sup>57</sup>), from Kuss,<sup>41</sup> and from Straty,<sup>43</sup> see Sec. 2.5 and Table 8.

For each author in Table 7 we give the relative weight of his data for least squares, obtained by taking the sum of weights over the points of one author, and dividing by the sum of weights for all  $P\rho T$  data points, expressing the result in percent.

After this manuscript was completed, additional data (Refs. 66 and 67) were kindly communicated by K. M. de Reuck of the IUPAC Thermodynamic Tables Project Centre.

### 2.5. The Equation of State

The present isochoric EOS is similar to that used recently for carbon monoxide,<sup>9</sup> designed to conform with the negative curvatures of high-density isochores seen in Fig. 5. For any density (isochore) the coexistence temperature,  $T_\sigma(\rho)$ , is obtained by iteration from equations for the orthobaric densities, and thus the vapor pressure,  $P_\sigma[T_\sigma(\rho)]$ , is a function of density,

$$P - P_\sigma(\rho) = \rho R [T - T_\sigma(\rho)] + \sigma(\rho R T_c) F(\rho, T), \quad (6)$$

$$F(\rho, T) \equiv A_1(u-1) + A_2 \rho f_2(\rho, T) + D(\rho) f_3(\rho, T) + E(\rho) f_4(\rho, T), \quad (6a)$$

where  $u(\rho, T) \equiv T/T_\sigma(\rho)$ ,  $R$  is the gas constant,  $\sigma$  is the reduced density, and

$$D(\rho) \equiv A_3 + A_4 \rho, \quad E(\rho) \equiv A_5(\rho-1) \exp(-\gamma \rho^2).$$

FIG. 3.  $P$ - $T$  map of some benzene  $P_pT$  data.

The temperature-dependent functions in Eq. (6a) are

$$f_2(\rho, T) \equiv \ln[(1 + u^2)/2], \quad (6b)$$

$$f_3(\rho, T) \equiv \ln[1 + \delta(u - 1)]/\delta, \quad (6c)$$

$$f_4(\rho, T) \equiv [\psi_\sigma(\rho) - \psi(\rho, T)]\eta/(\eta - 1), \quad (6d)$$

where

$$\psi(\rho, T) \equiv \omega - \omega^\eta/\eta, \quad (6e)$$

and  $\psi_\sigma(\rho)$  is obtained from  $\psi(\rho, T)$  by replacing  $T$  with  $T_\sigma(\rho)$ . The function  $\omega(\rho, T)$  is defined by

$$\omega(\rho, T) \equiv [1 - \theta(\rho)/T], \quad (6f)$$

where  $\theta(\rho)$  is a locus of temperatures inside the coexistence envelope of Fig. 1,

$$\theta(\rho) \equiv T_\sigma(\rho) \exp[-\alpha g(\rho)], \quad (6g)$$

$$g(\rho) \equiv |\sigma - 1|^3/(\sigma_t - 1)^3, \quad (6h)$$

and  $\sigma_t$  is the reduced density of liquid at the triple point.

The function  $f_2(\rho, T)$  has zero curvature versus  $T$  (an inflection) at the coexistence boundary ( $u = 1$ ), whereas  $f_3(\rho, T)$  has its greatest curvature at this boundary. Function

$f_4(\rho, T)$  is designed for a maximum in isochoric specific heats at the critical point, as for carbon monoxide.<sup>9</sup> An exponent value  $\eta = 1.10$  in Eq. (6e) is assigned because it cannot be found by fitting  $P_pT$  data.<sup>8</sup> Values for parameters  $\alpha$ ,  $\gamma$ , and  $\delta$  were estimated to optimize the fit of  $P_pT$  data by Eq. (6). At the critical point, the slope of the critical isochore from Eq. (6) has been constrained to equal the slope of vapor-pressure Eq. (2) via the least-squares program of McCarty.<sup>68</sup> This constraint has been found to give a well-behaved critical isotherm,  $P(\rho, T_c)$ , with no negative slopes,  $(\partial P/\partial\rho)_{T_c}$ .

The parameters and least-squares coefficients for Eq. (6) are the following:

$$\alpha = 0.20, \quad \gamma = 0.50, \quad \delta = 5.0, \quad \eta = 1.10,$$

$$A_1 = 0.743\ 559\ 507, \quad A_4 = 0.504\ 701\ 641,$$

$$A_2 = 0.397\ 531\ 574, \quad A_5 = 0.620\ 969\ 008.$$

$$A_3 = -0.765\ 372\ 414,$$

For least-squares determination of the coefficients in Eq. (6) we have used a total of about 500  $P_pT$  data: from the virial equation (Al-Bizreh and Wormald<sup>57</sup>); from Kuss,<sup>41</sup> and from Straty.<sup>43</sup> The number of available  $P_pT$  data from all authors is at least 1510. Table 8 presents deviations of experimental densities and pressures from the EOS, Eq. (6). The least satisfactory representation of the Straty<sup>43</sup> data in this table occurs along isochores near the critical density,  $\rho_c = 3.9$  mol/L. Table 9 gives properties computed along the critical isotherm at reduced densities from 0.5 through 1.5.

### 3. Thermal Properties and Computations

#### 3.1. Functions for Ideal Gas States

Recent tables of ideal gas state thermofunctions for benzene were contributed by Dr. Jing Chao of the Thermodynamics Research Center (TRC)<sup>69</sup> in July, 1983. The data in Table 10 are formulated by using  $x(T) \equiv T/100$ , and  $\epsilon = 8.60$ ,

$$C_p^\circ(T)/R = 4 + f(x) \exp(-\epsilon/x), \quad (7)$$

$$f(x) = \sum_{i=1}^5 A_i x^{1-i},$$

where

$$A_1 = 34.383\ 386, \quad A_4 = -1066.570\ 15, \\ A_2 = 129.858\ 849, \quad A_5 = 1697.128\ 98, \\ A_3 = 415.777\ 762,$$

Interpolated results up to 1000 K are presented in Table 11. Numerical integrations are performed to obtain functions from Eq. (7), starting with values at 300 K.

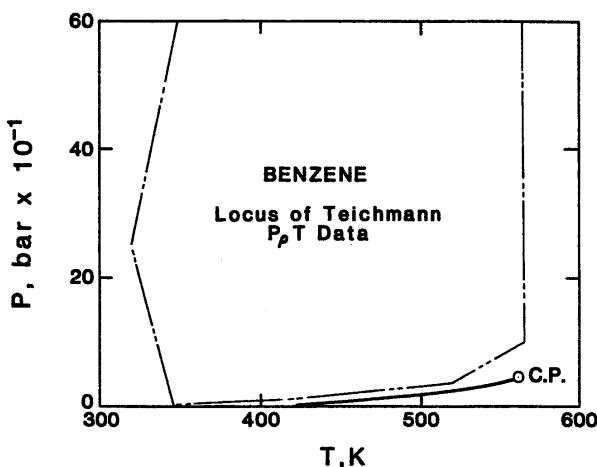

#### 3.2. Saturated Liquid Properties

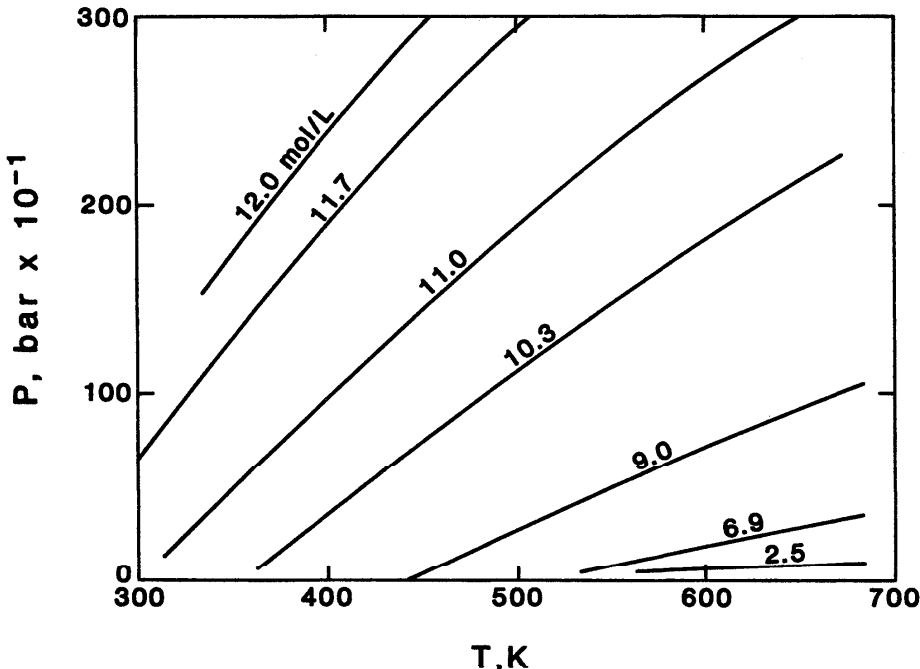

##### 3.2.a. Enthalpies of Vaporization

The Clapeyron equation,

$$\Delta_{\text{vap}} H / (\text{J/mol}) = 100T(dP_\sigma/dT)(v_g - v_l) \quad (8)$$

is used to derive enthalpies of vaporization  $\Delta_{\text{vap}} H$ , where  $dP_\sigma/dT$  from Eq. (2) is in units of bar/K, and the orthobaric volumes,  $v_g$  and  $v_l$ , in L/mol are from Eqs. (3) and (4).

FIG. 4.  $P$ - $T$  map of  $P_pT$  data of Teichmann<sup>38</sup>.

FIG. 5.  $P$ - $T$  plot of  $P_pT$  data of Gehrig and Lentz<sup>58</sup>.

### 3.2.b. Enthalpies of Saturated Liquid

Data for the enthalpy  $H_\sigma(T)$  along the saturated liquid boundary,  $H_\sigma(T)$ , were derived by using the ideal gas enthalpy, the EOS, and the enthalpy of vaporization. They are represented using argument  $u(T) \equiv (T_c - T)/(T_c - T_t)$ :

$$(H_\sigma - H_c)/(H_t - H_c) = u + (u^\beta - u) \sum_{i=1}^6 A_i u^{i-1}, \quad (9)$$

where  $\beta = 0.35$ ,  $H_t = 0.417$  J/mol,  $H_c = 53\,783.950$  J/mol, and

$$\begin{aligned} A_1 &= 0.241\,884\,930, & A_4 &= 0.860\,385\,975, \\ A_2 &= 0.326\,313\,907, & A_5 &= -0.801\,031\,901, \\ A_3 &= -0.405\,280\,020, & A_6 &= 0.241\,845\,641. \end{aligned}$$

For 18 data at  $T_t < T < T_c$ , the rms relative deviation is 0.008%, and the maximum absolute deviation is 3.9 J/mol at 561 K.

### 3.2.c. Entropies of Saturated Liquid

Data for the entropy along the saturated liquid boundary,  $S_\sigma(T)$ , derived as for  $H_\sigma(T)$  above, are represented by using  $x(T) \equiv T/T_c$ ,  $u(T) \equiv (1-x)$ , when

$$(S_\sigma - S_c)/(S_t - S_c) = A_1 u^\beta + A_2 \ln(x) + \sum_{i=3}^5 A_i u^{i-2}, \quad (10)$$

where  $\beta = 0.35$ ,  $S_t = 163.795\,56$  J/(mol K),  $S_c = 288.797\,05$  J/(mol K), and

$$\begin{aligned} A_1 &= 0.230\,785\,854, & A_4 &= 0.079\,145\,358, \\ A_2 &= -1.676\,590\,854, & A_5 &= -1.390\,830\,632, \\ A_3 &= -0.394\,963\,276, & & \end{aligned}$$

For 18 data at  $T_t < T < T_c$ , the rms relative deviation is

0.006%, and maximum deviations are under 0.04 J/(mol K).

### 3.2.d. Specific Heats of Saturated Liquid

Specific heats,  $C_\sigma(T)$  in J/(mol K), along the liquid coexistence path, are derived from Eq. (10) via  $C_\sigma = T(dS_\sigma/dT)$ . Let  $S_n = (S_t - S_c)$ , and

$$\text{Sum} \equiv -A_1 \beta u^{\beta-1} + A_2/x + \sum_{i=3}^5 A_i (2-i) u^{i-3},$$

then

$$C_\sigma(T) = S_n x \text{Sum}. \quad (11)$$

Some comparisons with experimental data<sup>20,70</sup> are given in Table 12.

## 3.3. Computational Methods

The numerical values for  $U$  and  $H$  in this report are based on the assigned value  $U = 0$  for saturated liquid at the triple point, obtained by adding the arbitrary value  $H_0^\circ = H_0^\circ = 22\,279.294$  J/mol to the ideal gas state values of  $(U^\circ - U_0^\circ)$  and  $(H^\circ - H_0^\circ)$  from Eq. (7).

### 3.3.a. The Homogeneous Domain

The homogeneous domain of Fig. 1 includes all regions which can be attained by integration along isotherms starting at zero density without crossing the vapor-liquid dome, and without passing very close to the critical point.

We start our computations with ideal gas state thermodynamic functions at zero density, and then apply the Romberg numerical integration technique<sup>71</sup> along isotherms by using equation of state (6) in the following relations,

$$\Delta U = \int \left[ P - T \left( \frac{\partial P}{\partial T} \right) \right] \frac{dp}{\rho^2}, \quad (12)$$

San Jose <sup>70</sup> , $C_p$			
T K	$C_p$ J/(mol-K)	$C_p$ (calc) J/(mol-K)	% Dev.
433.15	173.41	175.46	-1.17
453.15	182.79	182.86	-0.04
463.15	188.25	186.93	0.71
473.15	193.72	191.37	1.23
483.15	200.75	196.39	2.22
493.15	208.54	202.26	3.10

$$\Delta C_v = -T \int \left( \frac{\partial^2 P}{\partial T^2} \right) \frac{dp}{\rho^2}, \quad (13)$$

$$\Delta S = R \ln \left[ \frac{P^\circ}{(\rho RT)} \right] + \int_0^\rho \left[ R - \left( \frac{\partial P}{\partial T} \right) / \rho \right] \frac{dp}{\rho}. \quad (14)$$

Equation (14) is for use with initial entropies in hypothetical ideal gas states at  $P^\circ = 1$  atm (1.013 25 bar). For all other initial states we use

$$\Delta S = - \int \left( \frac{\partial P}{\partial T} \right) \frac{dp}{\rho^2}. \quad (14a)$$

In each  $(\rho, T)$  state, reached by above integrations, we compute

$$H = U + P/\rho, \quad (15)$$

$$C_p = C_v + T \left[ \left( \frac{\partial P}{\partial T} \right)^2 / \left( \frac{\partial P}{\partial \rho} \right) \right] / \rho^2, \quad (16)$$

$$W^2 = C_p \left( \frac{\partial P}{\partial \rho} \right) / C_v. \quad (17)$$

The fugacity/pressure ratio,  $f/P$ , for any state is computed by reference to the hypothetical ideal gas state at the same temperature and at  $P^\circ \equiv 1$  atm (1.013 25 bar):

$$f/P = (P^\circ/P) \exp(\Delta G/RT), \quad (18)$$

$$\Delta G = (H - U_0^\circ) - H^\circ - T(S - S^\circ),$$

where  $\Delta G$  is the isothermal Gibbs free-energy change, and the selected value  $U_0^\circ$  was added to the tabulated values for  $H(\rho, T)$  relative to  $(H^\circ - H_0^\circ)$  from Eq. (7).

### 3.3.b. The Saturated Liquid

At temperatures from the triple point to the critical point, thermodynamic functions for the saturated vapor are obtained via Eqs. (12)–(15). Then Eq. (8) for the enthalpy of vaporization,  $\Delta_{\text{vap}} H$ , is used to compute

$$\Delta H = -\Delta_{\text{vap}} H, \quad \Delta S = \Delta H/T, \quad (19)$$

such that the free-energy of vaporization,  $\Delta G \equiv \Delta H - T\Delta S$ , is zero. See Sec. 3.2 for consistency of the formulations. Having obtained  $H$  and  $S$  for the saturated liquid,  $U = H - Pv$  is computed.

The single-phase isochoric specific heat,  $C_\nu(T)_\sigma$ , at the saturated liquid boundary, is obtained via Eq. (11) for  $C_\nu(T)$  and the relation

$$C_\nu(T)_\sigma = C_\nu(T) + T \left( \frac{\partial P}{\partial T} \right) \left( \frac{dp_1}{dT} \right) / \rho_1^2, \quad (20)$$

where  $\rho_1$  is density of the saturated liquid. Values for  $C_p(\rho, T)$  and  $W(\rho, T)$  at this boundary follow from Eqs. (16) and (17).

### 3.3.c. The Compressed Liquid

Starting with the above values for  $U$ ,  $S$ , and  $C_\nu(T)_\sigma$  on the saturated liquid boundary at  $T < T_c$ , we use Eqs. (12), (13), and (14a) to integrate along isotherms, and then obtain  $H$ ,  $C_p$ , and  $W$  via Eqs. (15)–(17).

### 3.4. Comparisons

Specific heats  $C_\sigma(T)$  for saturated liquid were measured by Oliver *et al.*<sup>20</sup> up to 353 K. San Jose *et al.*<sup>70</sup> give  $C_p$

( $T$ ) at this boundary from 433 to 493 K. Table 12 gives comparisons using Eq. (11), which is based on derived entropies for the saturated liquid. Differences of only a few percent are quite acceptable for these exacting computations.

Enthalpy data for the coexisting vapor (gas) and liquid phases, reported by Gorbunova *et al.*,<sup>54</sup> are compared with computed results in Table 13. We added 2.8 kJ/mol to their enthalpies to obtain correspondence with our values. Differences are on the order of 0.1 kJ/mol. Their enthalpies along isotherms are compared with computed results in Table 14. Differences are on the order of 0.1 to 0.3 kJ/mol.

Enthalpy data for the coexisting vapor (gas) and liquid phases, reported by Lenoir *et al.*,<sup>72</sup> are compared with computed results in Table 15. We subtracted 0.073 kJ/mol from their enthalpies. Differences are on the order of 0.1 to 0.2 kJ/mol. Their enthalpies along isotherms are compared with computed results in Table 16. Most differences again are on the order of a few tenths of 1 kJ/mol.

Isobaric heat capacities of Rastorguev *et al.*<sup>73</sup> are compared with computed results in the first part of Table 17. In the second part comparisons are made with some data along isobars, selected from the copious measurements reported by Akhundov and Sultanov,<sup>74</sup> and by Mamedov *et al.*<sup>59,75,76</sup> Figure 6 gives comparisons of these data along the 60 bar isobar to show that the computed maximum agrees well with experiment.

Speeds of sound at coexistence are compared in Table 18 with data of Zotov *et al.*,<sup>77,78</sup> Aniskin,<sup>79</sup> and Bobik.<sup>80</sup> Table 19 gives comparisons of the EOS with data along isotherms of Aniskin,<sup>79</sup> Makita and Takagi,<sup>26</sup> Otpushchennikov *et al.*,<sup>81</sup> Bobik,<sup>80</sup> and of Pankevich<sup>82</sup> and Pankevich and Zotov.<sup>83</sup> Whereas some deviations are systematic, agreements, generally within a few percent, are reasonable for this exacting computation. Appendix A gives a comprehensive list of references for specific heats,<sup>6,20,31,53,59,60,70,73–76,84–87</sup> for enthalpies of vaporization,<sup>31,39,49–54,72,88,89</sup> and for sound speeds<sup>26,77,79–83,90,91</sup> of benzene.

## 4. Tables of Thermophysical Properties

All of the following tabulated properties are interpolated or extrapolated in ranges where no  $P\rho T$  compressibility data exist as shown in Table 7.

### 4.1. Joule-Thomson Inversion Locus

The  $P-\rho-T$  locus of the Joule-Thomson inversion,  $(\partial T/\partial P)_{II} = 0$ , is presented in Table 20. This is computed using the EOS. For each temperature, the density is iterated to satisfy the condition  $T(\partial P/\partial T) = \rho(\partial P/\partial \rho)$ , by starting with an initial trial density,  $\rho_i$ ,

$$\rho_i/\rho_c = \exp[1.17 - 0.44 \cdot T/T_c]. \quad (21)$$

### 4.2. Properties at Coexistence

Table 21 gives properties at the saturated liquid coexistence boundary, computed as described in Secs. 3.2 and 3.3 above.

#### 4.3. Properties Along Selected Isobars

Table 22 gives thermophysical properties along selected isobars, computed as described in Sec. 3.3 via the EOS of Eq. (6). Each isobar starts at the freezing liquid on the melting line of Eq. (1). At pressures below the critical, each table contains a blank line for the transition from saturated liquid to vapor at the constant coexistence temperature. For compressed liquid states at  $T < T_c$ , properties are based on the formulated saturated liquid properties of Eqs. (9), (10), (11), and (20). The Joule-Thomson coefficients,  $\mu$ , in Table 22 are computed using the EOS and derived  $C_p$  values by the relation

$$\mu/(K/bar) = 100 \left[ T \left( \frac{\partial P}{\partial T} \right) / \left( \frac{\partial P}{\partial \rho} \right) / \rho - 1 \right] / \rho / C_p. \quad (22)$$

Small discontinuities at  $T = T_c$  along isobars at  $P > P_c$  are expected, due to change in the paths of computation from  $T < T_c$  to  $T > T_c$ . In particular, the values of  $C_v$ ,  $C_p$ , and  $W$  for compressed liquid near  $T_c$  must be affected by the inherent, wide margin of uncertainty for  $C_v(T)_\sigma$  as derived via Eq. (20).

Table 22. Properties of benzene along isobars

## 5. Acknowledgments

This work could not have been accomplished without the generous assistance of the following individuals. Mr. Frank Williamson searched the literature, provided documents, and prepared the final tables; also Dr. Selby Angus and Mrs. K. M. de Reuck of the I.U.P.A.C. Thermodynamic Tables Project Centre, London, have been most helpful in communicating their references. Robert D. McCarty contributed the essential least-squares computer program.<sup>68</sup> James F. Ely indicated the numerical integration technique,<sup>71</sup> and the method for computing fugacities. Appreciation is expressed to Karen A. Bowie for devotion in preparing the final manuscript. Support from the NBS Office of Standard Reference Data is gratefully acknowledged.

Appendix A. (*continued*)

Reference	Year	Type	(Range of $T$ )/K	(Range of $P$ )/bar
Speed of sound				
Makita (Ref. 26)	1968	$W(T,P)$	283–343	20–2000
Zotov (Ref. 77)	1968	$W_c(T)$	303–560	...
Deshpande (Ref. 90)	1971	$W(\rho,T)$	298–318	1
Otpushchennikov (Ref. 81)	1974	$W(\rho,T)$	313–363	28–850
Pankevich (Ref. 82)	1974	$W(\rho,T)$	403–603	20–690
Pankevich (Ref. 83)	1976	$W(\rho,T)$	293–503	20–1080
Pankevich (Ref. 83)	1976	$W(\rho,T)$	453–603	30–500
Aniskin (Ref. 79)	1978	$W_c(T)$	453–558	...
Aniskin (Ref. 79)	1978	$W(\rho,T)$	503–593	18
Bobik (Ref. 80)	1978	$W_c(T)$	280–550	...
Bobik (Ref. 80)	1978	$W(T,P)$	300–463	2–600
Takagi (Ref. 91)	1984	$W(T,P)$	293–303	1–1600
$P\rho T$ compressibility data				
Essex (Ref. 61)	1914		293–373	1–3000
Richards (Ref. 62) <sup>a</sup>	1921		293	100–500
Bridgman (Ref. 63)	1930		323–368	0–3500
Gibson (Ref. 64) <sup>a</sup>	1938		298–335	1–1000
Gornowski (Ref. 10)	1947		513–628	26–67
Glanville (Ref. 44)	1949		378–511	7–690
Connolly (Ref. 15)	1962		403–543	5–180
Tashimi (Ref. 60) <sup>a</sup>	1969		298–353	100–1800
Kuss (Ref. 41) <sup>a</sup>	1976		298–353	100–2000
Mamedov (Ref. 59)	1976		298–673	100–510
Gehrig (Ref. 58)	1977		323–683	50–3000
Kurumov (Ref. 48)	1977		283–298	15–780
Figuière (Ref. 48)	1978		298–324	10–1470
Pena (Ref. 65) <sup>a</sup>	1978		298–333	...
Teichmann (Ref. 38)	1978		320–566	20–600
Straty (Ref. 43)	1986		423–723	33–350

<sup>a</sup>These authors give isothermal compressibilities,  $\rho \left( \frac{\partial P}{\partial \rho} \right)_T$ .
